

# UT8ER1M32 32Megabit SRAM MCM

## UT8ER2M32 64Megabit SRAM MCM

### UT8ER4M32 128Megabit SRAM MCM

Data Sheet

May 2018

The most important thing we build is trust

#### FEATURES

- ❑ 20ns Read, 10ns Write maximum access times available
- ❑ Functionally compatible with traditional 1M, 2M and 4M x 32 SRAM devices
- ❑ CMOS compatible input and output levels, three-state bidirectional data bus
  - I/O Voltages 2.3V to 3.6V, 1.7V to 2.0V<sub>core</sub>
- ❑ Available densities:
  - UT8ER1M32: 33, 554, 432 bits
  - UT8ER2M32: 67, 108, 864 bits
  - UT8ER4M32: 134, 217, 728 bits
- ❑ Operational environment:
  - Total-dose: 100 krad(Si)
  - SEL Immune:  $\leq 110$  MeV-cm<sup>2</sup>/mg
  - SEU error rate =  $8.1 \times 10^{-16}$  errors/bit-day assuming geosynchronous orbit, Adam's 90% worst environment, and 6600ns default Scrub Rate Period (=97% SRAM availability)
- ❑ Packaging option:
  - 132-lead side-brazed dual cavity ceramic quad flatpack
- ❑ Standard Microelectronics Drawing:
  - UT8ER1M32: 5962-10202
    - QML Q, Q+ and V compliant
  - UT8ER2M32: 5962-10203
    - QML Q, Q+, and V compliant
  - UT8ER4M32: 5962-10204
    - QML Q and Q+ compliant

#### INTRODUCTION

The UT8ER1M32, UT8ER2M32, and UT8ER4M32 are high performance CMOS static RAM multichip modules (MCMs) organized as two, four or eight individual 524,288 words x 32 bits dice respectively. Easy memory expansion is provided by active LOW chip enables ( $\overline{E_n}$ ), an active LOW output enable ( $\overline{G}$ ), and three-state drivers. This device has a power-down feature that reduces power consumption by more than 90% when deselected. Autonomous (master) and demanded (slave) scrubbing continues while deselected.

Writing to the device is accomplished by driving one of the chip enable ( $\overline{E_n}$ ) inputs LOW and the write enable ( $\overline{W}$ ) input LOW. Data on the 32 I/O pins (DQ0 through DQ31) is then written into the location specified on the address pins (A0 through A18). Reading from the device is accomplished by driving one of the chip enables ( $\overline{E_n}$ ) and output enable ( $\overline{G}$ ) LOW while driving write enable ( $\overline{W}$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins. **Note:** Only on  $\overline{E_n}$  pin may be active at any time.

The 32 input/output pins (DQ0 through DQ31) are placed in a high impedance state when the device is deselected ( $\overline{E_n}$  HIGH), the outputs are disabled ( $\overline{G}$  HIGH), or during a write operation ( $\overline{E_n}$  LOW,  $\overline{W}$  LOW).

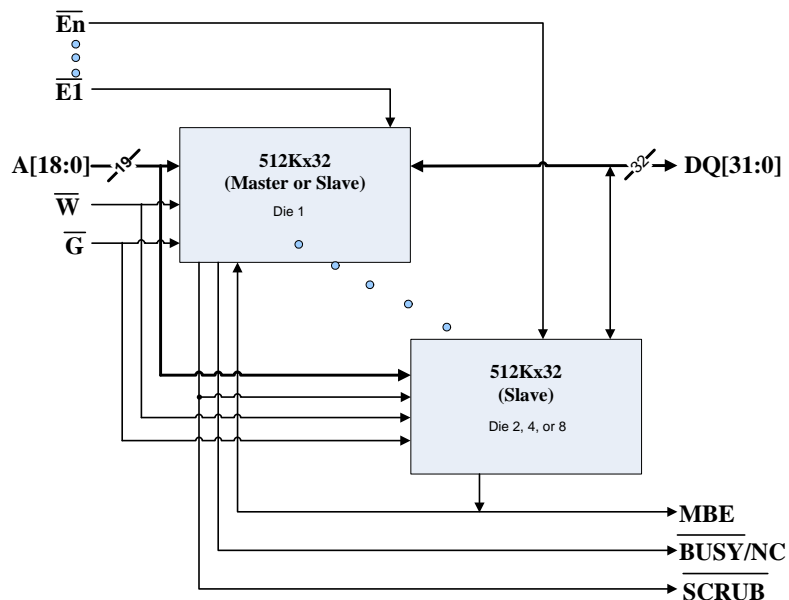

Figure 1. Block Diagram

**Notes:**

1. NC = Pins are not connected on die.
2. (NC) = Depending on device option, pin may be either signal as named or NC (see Table 1).

**Figure 2. Pin Diagram**

**Table 1. Pin Description**

<b>Pin</b>	<b>Type</b>	<b>Description</b>
A(18:0)	I	Address Input
DQ(31:0)	BI	Data Input/Output
En#*	I	Enable (Active Low)
W#	I	Write Enable (Active Low)
G#	I	Output Enable (Active Low)
VDD1	P	Power (1.8V nominal)
VDD2	P	Power (3.3V nominal)
VSS	P	Ground
MBE	BI	Multiple Bit Error
SCRUB#	I	Slave SCRUB Input (Active Low)
SCRUB#	O	Master SCRUB Output
BUSY#	NC	Slave No Connect
BUSY#	O	Master Wait State Control

**Notes:**

\* n represents any number of individual MCM (multichip module) die enables. May be 1-8 depending on device option.

**Notes:**

NC Pins are not connected on the die

1. BUSY# pin is an output for master devices only, and is a NC for slave devices.
2. Control input when shown as En#, otherwise pin is NC.
3. SCRUB# is an output for master devices, but an input for slave devices.

## MASTER or SLAVE OPTIONS

To reduce the bit error rates, the SRAM devices employ an embedded EDAC (error detection and correction) with user programmable auto scrubbing options. The SRAM devices can automatically correct single bit word errors in event of an upset. During a read operation, if a multiple bit error occurs in a word, the SRAMs assert the MBE output to notify the host.

All SRAM devices are offered in two options: Master (UT8ER1M32M, UT8ER2M32M and UT8ER4M32M) or Slave (UT8ER1M32S, UT8ER2M32S and UT8ER4M32S). The masters are a full function device which features user defined autonomous EDAC scrubbing options. The slave device employs a scrub on demand feature.

The master and slave device pins  $\overline{\text{SCRUB}}$  and  $\overline{\text{BUSY}}$  are physically different. The  $\overline{\text{SCRUB}}$  pin is an output on the master device, but an input on the slave device. The master  $\overline{\text{SCRUB}}$  pin asserts low when a scrub cycle initiates, and can be used to demand scrub cycles from multiple slave units when connected to the  $\overline{\text{SCRUB}}$  input of slave(s). The  $\overline{\text{BUSY}}$  pin is an output for the master device and can be used to generate wait states by the memory controller. The  $\overline{\text{BUSY}}$  pin is a no connect (NC) for slave devices.

## DEVICE OPERATION

The SRAMs have control inputs called Chip Enable ( $\overline{\text{En}}$ ), Write Enable ( $\overline{\text{W}}$ ), and Output Enable ( $\overline{\text{G}}$ ); 19 address inputs, A(18:0); and 32 bidirectional data lines, DQ(31:0). The  $\overline{\text{En}}$  (chip enable) controls selection between active and standby modes. Asserting  $\overline{\text{En}}$  enables the device, causes  $I_{\text{DD}}$  to rise to its active value, and decodes the 19 address inputs. Only one chip enable may be active at any time.  $\overline{\text{W}}$  controls read and write operations. During a read cycle,  $\overline{\text{G}}$  must be asserted to enable the outputs.

**Table 3. SRAM Device Control Operation Truth Table**

$\overline{\text{G}}$	$\overline{\text{W}}$	$\overline{\text{En}}$	I/O Mode	Mode
X	X	H	DQ(31:0) 3-State	Standby
L	H	L	DQ(31:0) Data Out	Word Read
H	H	L	DQ(31:0) All 3-State	Word Read <sup>2</sup>
X	L	L	DQ(31:0) All 3-State	Word Write

**Notes:**

1. "X" is defined as a "don't care" condition.
2. Device active; outputs disabled.

**Table 4. EDAC Control Pin Operation Truth Table**

MBE	$\overline{\text{SCRUB}}$	$\overline{\text{BUSY}}$	I/O Mode	Mode
H	H	H	Read	Uncorrectable Multiple Bit Error
L	H	H	Read	Valid Data Out
X	H	H	X	Device Ready
X	H	L	X	Device Ready / Scrub Request Pending
X	L	X	Not Accessible	Device Busy

**Notes:**

1. "X" is defined as a "don't care" condition
2.  $\overline{\text{BUSY}}$  signal is a "NC" for slave devices and are an "X" don't care.

## READ CYCLE

A combination of  $\overline{\text{W}}$  greater than  $V_{\text{IH}}$  (min) with a single  $\overline{\text{En}}$  and  $\overline{\text{G}}$  less than  $V_{\text{IL}}$  (max) defines a read cycle. Read access time is measured from the latter of device enable, output enable, or valid address to valid data output. Read cycles initiate with the assertion of any chip(s) enable or any address input change while any or all chip enables are asserted.

SRAM Read Cycle 1, the Address Access in Figure 3a, is initiated by a change in address inputs after a single  $\overline{\text{En}}$  is asserted,  $\overline{\text{G}}$  is asserted,  $\overline{\text{W}}$  is deasserted and all are stable. Valid data appears on data outputs DQ(31:0) after the specified  $t_{\text{AVQV}}$  is satisfied. Outputs remain active throughout the entire cycle. As long as device enable and output enable are active, the minimum time between valid address changes is specified by the read cycle time ( $t_{\text{AVAV}}$ ). Changing addresses, prior to satisfying  $t_{\text{AVAV}}$  minimum, results in an invalid operation. Invalid read cycles will require reinitialization.

SRAM Read Cycle 2, the Chip Enable-controlled Access in Figure 3b is initiated by a single  $\overline{\text{En}}$  going active while  $\overline{\text{G}}$  remains asserted,  $\overline{\text{W}}$  remains deasserted, and the addresses remain stable for the entire cycle. After the specified  $t_{\text{ETQV}}$  is satisfied, the 32-bit word addressed by A(18:0) is accessed and appears at the data outputs DQ(31:0).

SRAM Read Cycle 3, the Output Enable-controlled Access in Figure 3c, is initiated by  $\overline{\text{G}}$  going active while a single  $\overline{\text{En}}$  is asserted,  $\overline{\text{W}}$  is deasserted, and the addresses are stable. Read access time is  $t_{\text{GLQV}}$  unless  $t_{\text{AVQV}}$  or  $t_{\text{ETQV}}$  (reference Figure 3b) have not been satisfied.

SRAM EDAC Status Indications during a Read Cycle, if MBE is Low, the data is valid. If MBE is High, the data is corrupted (reference Table 3).

## WRITE CYCLE

A combination of  $\overline{W}$  and a single  $\overline{En}$  less than  $V_{IL}(\max)$  defines a write cycle. The state of  $\overline{G}$  is a “don’t care” for a write cycle. The outputs are placed in the high-impedance state when either  $\overline{G}$  is greater than  $V_{IH}(\min)$  or when  $\overline{W}$  is less than  $V_{IL}(\max)$ .

Write Cycle 1, the Write Enable-controlled Access in Figure 4a, is defined by a write terminated by  $\overline{W}$  going high with a single  $\overline{En}$  still active. The write pulse width is defined by  $t_{WLWH}$  when the write is initiated by  $\overline{W}$  and by  $t_{ETWH}$  when the write is initiated by  $\overline{En}$ . To avoid bus contention  $t_{WLQZ}$  must be satisfied before data is applied to the 32 bidirectional pins DQ(31:0) unless the outputs have been previously placed in high impedance state by deasserting  $\overline{G}$ .

Write Cycle 2, the Chip Enable-controlled Access in Figure 4b, is defined by a write terminated by a single  $\overline{En}$ . The write pulse width is defined by  $t_{WLEF}$  when the write is initiated by  $\overline{W}$  and by  $t_{ETEF}$  when the write is initiated by  $\overline{En}$  going active. For the  $\overline{W}$  initiated write, unless the outputs have been previously placed in the high-impedance state by  $\overline{G}$ , the user must wait  $t_{WLQZ}$  before applying data to the 32 bidirectional pins DQ(31:0) to avoid bus contention.

## CONTROL REGISTER WRITE/READ CYCLES

Configuration options can be selected by writing to the control register. The configuration tables (Tables 5 and 6) details the programming options. Scrub rate period and  $\overline{BUSY}$  to  $\overline{SCRUB}$  configurations are applicable to master devices using  $\overline{E1}$  chip enable only. EDAC bypass and Read/Write control register is applicable to all valid chip enables  $\overline{En}$ . The control register is accessed by applying a series of values to the address bus as shown in Figures 7a and 7b. After the series the contents of the control register can be either read or written depending on the value of the corresponding read/write control register address pin (A(9) for odd die and A(2) for even die). **NOTE:** MBE must be driven high by the user for both a write or a read of the control register.

## MEMORY SCRUBBING/CYCLE STEALING

The SRAMs use architectural improvements and embedded error detection and correction to maintain unsurpassed levels of error protection. This is accomplished by what Aeroflex refers to as Cycle Stealing. To minimize the system design impact on the speed of operation, the edge relationship between  $\overline{BUSY}$  and  $\overline{SCRUB}$  is programmable via the sequence described in figures 7a and 7b. The  $\overline{BUSY}$  output is intended to give notification to the memory controller that a scrub cycle is impending. Since the memory cannot be accessed during an internal scrub cycle, the  $\overline{BUSY}$  to  $\overline{SCRUB}$  delay can be adjusted so the user may complete accesses prior to internal scrubbing.

The effective error rate is a function of the intrinsic error rate and the environment. Therefore, users are given the ability to control the scrub rate (ref. figure 7a) appropriate for the applicable environment. **NOTE:** the scrub rate will have an inverse relationship to the total throughput of the memory.

A master mode scrub cycle will occur at the user defined Scrub Rate Period. A scrub cycle is defined as the verification and correction (if necessary) of data for a single word address location. Address locations are scrubbed sequentially every Scrub Rate Period ( $t_{SCRT}$ ). Scrub cycles will occur at every Scrub Rate Period regardless of the status of control pins. All inputs should remain stable while the  $\overline{SCRUB}$  signal is active to avoid data corruption. Control pin function will be returned upon deassertion of  $\overline{BUSY}$  pin. The Slave mode scrub cycle occurs anytime the  $\overline{SCRUB}$  pin is asserted. The scrub cycle is defined the same as the master mode and will occur regardless of control pin status. Control pin function will be returned upon  $\overline{SCRUB}$  deassertion.

Data is corrected during not only the internal scrub, but again during a user requested read cycle. If the data presented contains two or more errors after  $t_{AVAV}$  is satisfied, the MBE signal will be asserted. (**Note:** Reading un-initialized memory locations may result in un-intended MBE assertions.)

**Table 5. Operational Environment<sup>1</sup>**

Total Dose	100k	rads(Si)
Heavy Ion Error Rate <sup>2</sup>	$8.1 \times 10^{-16}$	Errors/Bit-Day

**Notes:**

1. The SRAM is immune to latchup to particles  $\leq 110\text{MeV}\cdot\text{cm}^2/\text{mg}$ .
2. 90% worst case particle environment, Geosynchronous orbit, 100 mils of Aluminum and default EDAC scrub rate.

## SUPPLY SEQUENCING

No supply voltage sequencing is required between  $V_{DD1}$  and  $V_{DD2}$ .

## POWER-UP REQUIREMENTS

During power-up of the SRAM devices, the power supply voltages will transverse through voltage ranges where the device is not guaranteed to operate before reaching final levels. Since some circuits on the device may operate at lower voltage levels than others, the device may power-up in an unknown state. To eliminate this with most power-up situations, the device employs an on-chip power-on-reset (POR) circuit. The POR, however, requires time to complete the operation. Therefore, it is recommended that all device activity be delayed by a minimum of 100ms, after both  $V_{DD1}$  and  $V_{DD2}$  supplies have reached stable minimum operating voltage.

## ABSOLUTE MAXIMUM RATINGS<sup>1</sup>

(Referenced to  $V_{SS}$ )

SYMBOL	PARAMETER	LIMITS
$V_{DD1}$	DC supply voltage (Core)	-0.3 to 2.4V
$V_{DD2}$	DC supply voltage (I/O)	-0.3 to 4.5V
$V_{I/O}$	Voltage on any pin	-0.3 to 4.5V
$T_{STG}$	Storage temperature	-65 to +150°C
$P_D$ <sup>2</sup> : UT8ER1M32 UT8ER2M32 UT8ER4M32	Maximum package power dissipation permitted @ $T_c = +105^\circ\text{C}$	3.3W 2W 1.3W
$T_J$	Maximum junction temperature	+150°C
$\Theta_{JC}$ <sup>3</sup> : UT8ER1M32 UT8ER2M32 UT8ER4M32	Thermal resistance, junction-to-case <sup>2</sup>	6°C/W 10°C/W 15°C/W
$I_I$	DC input current	±10 mA

### Notes:

- Stresses outside the listed absolute maximum ratings may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond limits indicated in the operational sections of this specification is not recommended. Exposure to absolute maximum rating conditions for extended periods may affect device reliability and performance.
- Per MIL-STD-883, Method 1012, Section 3.4.1,  $P_D = \frac{(125^\circ\text{C} - 105^\circ\text{C})}{\Theta_{JC}}$
- $\Theta_{JC}$  varies with density due to stacked die configuration.

## RECOMMENDED OPERATING CONDITIONS

SYMBOL	PARAMETER	LIMITS
$V_{DD1}$	DC supply voltage (Core)	1.7 to 2.0V
$V_{DD2}$	DC supply voltage (I/O)	2.3 to 3.6V
$T_C$	Case temperature range	-55 to +105°C
$V_{IN}$	DC input voltage	0V to $V_{DD2}$

**DC ELECTRICAL CHARACTERISTICS (Pre and Post-Radiation)\***

( $V_{DD1} = 1.7V$  to  $2.0V$ ,  $V_{DD2} = 2.3V$  to  $3.6V$ ; Unless otherwise noted,  $T_c$  is per the temperature range ordered)

SYMBOL	PARAMETER	CONDITION		MIN	MAX	UNIT

## CAPACITANCE

SYMBOL	PARAMETER	CONDITION	UT8ER1M32		UT8ER2M32		UT8ER4M32		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	
$C_{IN}^2$	Input capacitance	$f = 1MHz @ 0V$		18		29		50	pF
$C_{En}^2$	Input capacitance Device Enables	$f = 1MHz @ 0V$		10		10		10	pF
$C_{IO}^2$	Bidirectional I/O capacitance	$f = 1MHz @ 0V$		15		27		50	pF

### Notes:

- \* For devices procured with a total ionizing dose tolerance guarantee, the post-irradiation performance is guaranteed at 25°C per MIL-STD-883 Method 1019, Condition A up to the maximum TID level procured.
- 1. The SCRUB and BUSY pins for UT8ER1M32M, UT8ER2M32M and UT8ER4M32M (master) are tested functionally for VOL specification.
- 2. Measured only for initial qualification and after process or design changes that could affect this parameter.
- 3. The SCRUB and BUSY pins for UT8ER1M32M, UT8ER2M32M and UT8ER4M32M (master) are guaranteed by design, but neither tested nor characterized.
- 4. Supplied as a design limit but not guaranteed or tested.
- 5. Not more than one output may be shorted at a time for maximum duration of one second.
- 6. EDAC enabled. Default Scrub Rate Period applicable to master device only.
- 7. Post radiation limits are the 105°C temperature limit when specified.
- 8. Operating current limit does not include standby current.
- 9. fmax = 50MHz.
- 10.  $V_{IH} = V_{DD2} (max)$ ,  $V_{IL} = 0V$ .

### AC CHARACTERISTICS READ CYCLE (Pre and Post-Radiation)\*

( $V_{DD1} = 1.7V$  to  $2.0V$ ,  $V_{DD2} = 2.3V$  to  $3.6V$ ); Unless otherwise noted,  $T_c$  is per the temperature range ordered

#### Notes:

\* For devices procured with a total ionizing dose tolerance guarantee, the post-irradiation performance is guaranteed at 25°C per MIL-STD-883 Method 1019, Condition A up to the maximum TID level procured.

1. Guaranteed by characterization, but not tested.
2. Three-state is defined as a change from steady-state output voltage.
3. Guaranteed by design.
4. Address changes prior to satisfying  $t_{AVAV}$  minimum is an invalid operation.

#### Notes:

\* For devices procured with a total ionizing dose tolerance guarantee, the post-irradiation performance is guaranteed at 25°C per MIL-STD-883 Method 1019, Condition A up to the maximum TID level procured.

1. Tested with  $\overline{G}$  high.

2. Three-state is defined as a change from steady-state output voltage.

**Assumptions:**

1.  $\overline{G} \leq V_{IL}(\text{max})$ . (If  $\overline{G} \geq V_{IH}(\text{min})$  then  $Q(31:0)$  and MBE will be in three-state for the entire cycle.)
2.  $\overline{SCRUB} \geq V_{OH}(\text{min})$

**Figure 4a. SRAM Write Cycle 1:  $\overline{W}$  - Controlled Access**

**Assumptions & Notes:**

1.  $\overline{G} \leq V_{IL}(\text{max})$ . (If  $\overline{G} \geq V_{IH}(\text{min})$  then Q(31:0) and MBE will be in three-state for the entire cycle.)
2.  $\overline{\text{Busy}} \geq V_{OH}(\text{min})$

**Figure 4b. SRAM Write Cycle 2: Enable - Controlled Access**

Note:

1. See Table 5 for Control Register Definitions

**Figure 5. (Odd Die Numbers ( $\overline{E1}$ ,  $\overline{E3}$ ,  $\overline{E5}$ ,  $\overline{E7}$  Chip Enables) EDAC Control Register**

**Table 6: (Odd Die Numbers ( $\overline{E1}$ ,  $\overline{E3}$ ,  $\overline{E5}$ ,  $\overline{E7}$  Chip Enables) EDAC Programming Configuration Table**

ADDR BIT	PARAMETER	VALUE	FUNCTION
A (3-0)	Scrub Rate Period <sup>1,2,3</sup>	3-15  Note: 0-2 reserved	As Scrub Rate Period changes from 0 - 15, then the interval between Scrub cycles will change as follows: 3 = 600 ns      8 = 13.0 us      12 = 205 us 4 = 1000 ns      9 = 25.8 us      13 = 409.8 us <sup>4</sup> 5 = 1800 ns      10 = 51.4 us      14 = 819.4 us <sup>4</sup> 6 = 3400 ns      11 = 102.6 us      15 = 1.64 ms <sup>4</sup> 7 = 6600 ns
A (7-4)	$\overline{\text{BUSY}}$ to $\overline{\text{SCRUB}}$ <sup>1,3,5</sup>	0-15	If $\overline{\text{BUSY}}$ to $\overline{\text{SCRUB}}$ changes from 0 - 15, then the interval $t_{\text{BLSL}}$ between $\overline{\text{SCRUB}}$ and $\overline{\text{BUSY}}$ will change as follows: 0 = 0 ns      6 = 300 ns      11 = 550 ns 1 = 50 ns      7 = 350 ns      12 = 600 ns 2 = 100 ns      8 = 400 ns      13 = 650 ns 3 = 150 ns      9 = 450 ns      14 = 700 ns 4 = 200 ns      10 = 500 ns      15 = 750 ns 5 = 250ns
A (8)	Bypass EDAC Bit <sup>6,7</sup>	0, 1	If 0, then normal EDAC operation will occur. If 1, then EDAC will be bypassed and no memory scrubbing will occur.
A (9)	Read / $\overline{\text{Write}}$ Control Register	0, 1	0 = A8 to A0 will be written to the control register. 1 = Control register will be asserted to the data bus DQ[8:0] respectively.

**Notes:**

1. Values based on minimum specifications. For guaranteed ranges of Scrub Rate Period ( $t_{\text{SCRUB}}$ ) and  $\overline{\text{BUSY}}$  to  $\overline{\text{SCRUB}}$  ( $t_{\text{BLSL}}$ ), reference the Master Mode AC Characteristic.
2. Default Scrub Rate Period is 6600 ns.
3. Scrub Rate Period and  $\overline{\text{BUSY}}$  to  $\overline{\text{SCRUB}}$  applicable to the master devices die #1 ( $\overline{E1}$  chip enable) only.
4. Period below test capability.
5. The default for  $t_{\text{BLSL}}$  is 500 ns.
6. The default state for A8 is 0.
7. The EDAC bypass option is provided for memory accesses when error correction is not desired (i.e. device and system testing).

Note:

X = Not applicable for even die.

1. See Table 6 for Control Register Definitions

**Figure 6. Even Die Numbers ( $\overline{E2}$ ,  $\overline{E4}$ ,  $\overline{E6}$ ,  $\overline{E8}$  Chip Enables) EDAC Control Register**

**Table 7: Even Die Numbers ( $\overline{E2}$ ,  $\overline{E4}$ ,  $\overline{E6}$ ,  $\overline{E8}$  Chip Enables) EDAC Programming Configuration Table**

ADDR BIT	PARAMETER	VALUE	FUNCTION
A (2)	Bypass EDAC Bit <sup>1,2</sup>	0, 1	If 0, then normal EDAC operation will occur. If 1, then EDAC will be bypassed and no memory scrubbing will occur.
A (1)	Read / $\overline{\text{Write}}$ Control Register	0, 1	0 = A2 will be written to the control register 1 = Control register will be asserted to the data bus DQ18

Notes:

1. The default state for A2 is 0.

2. The EDAC bypass option is provided for memory accesses when error correction is not desired (i.e. device and system testing).

### EDAC CONTROL REGISTER AC CHARACTERISTICS (Pre and Post-Radiation)\*

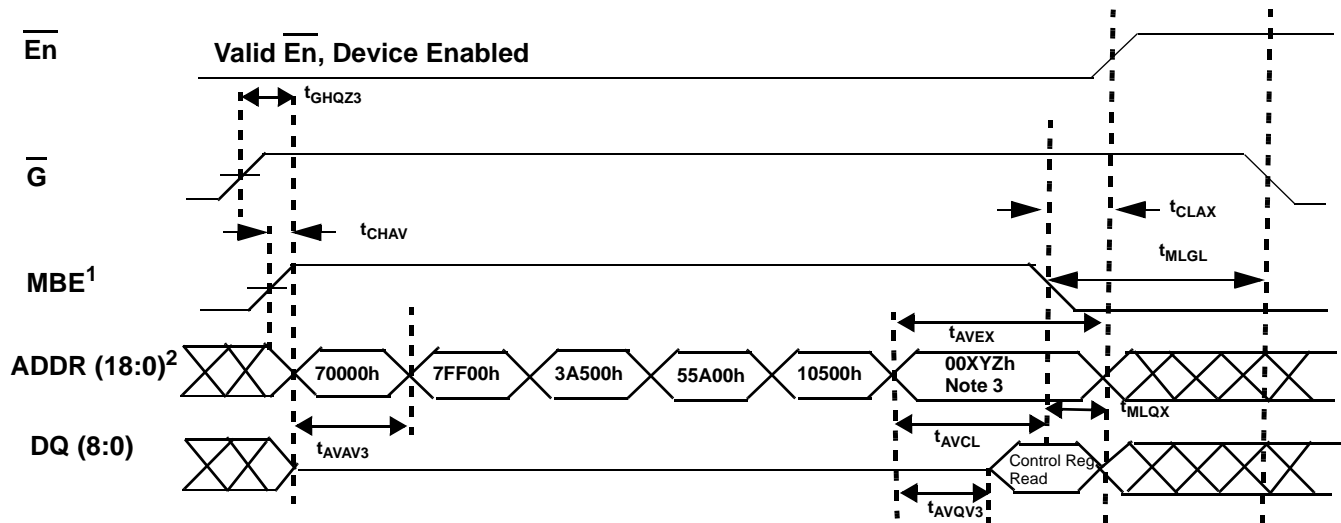

( $V_{DD1} = 1.7V$  to  $2.0V$ ,  $V_{DD2} = 2.3V$  to  $3.6V$ ); Unless otherwise noted,  $T_c$  is per the temperature range ordered

2. Prototype Flow per Aeroflex Manufacturing Flows Document. Devices are tested at 25°C only. Lead finish is GOLD "C" only. Radiation is neither tested nor guaranteed.
3. HiRel flow per Aeroflex Manufacturing Flows Document. Radiation is neither tested nor guaranteed.
4. Device option (21) is applicable to 32Mbit device types only. Option (22) is applicable to 64Mbit device types only. Option (25) is applicable to 128Mbit device types only.

**32Mbit (1Mx32) SRAM MCM:SMD**  
**64Mbit (2Mx32) SRAM MCM:SMD**  
**128Mbit (4Mx32) SRAM MCM:SMD**

**Notes:**

1. Lead finish is "C" (Gold) only.
2. Aeroflex's Q+ assembly flow, as defined in section 4.2.2.d of the SMD, provides QML-Q product through the SMD that is manufactured with Aeroflex's standard QML-V flow.
3. TID tolerance guarantee of 1E5 is tested in accordance with MIL-STD-883 Test Method 1019 (condition A and section 3.11.2) resulting in an effective dose rate of 1 rad(Si)/sec.

## ***Aeroflex Colorado Springs - Datasheet Definition***

**Advanced Datasheet - Product In Development**

**Preliminary Datasheet - Shipping Prototype**

**Datasheet - Shipping QML & Reduced Hi-Rel**

**This product is controlled for export under the Export Administration Regulations (EAR), 15 CFR Parts 730-774. A license from the Department of Commerce may be required prior to the export of this product from the United States.**

Aeroflex Colorado Springs Inc., DBA Cobham Semiconductor Solutions, reserves the right to make changes to any products and services described herein at any time without notice. Consult Aeroflex or an authorized sales representative to verify that the information in this data sheet is current before using this product. Aeroflex does not assume any responsibility or liability arising out of the application or use of any product or service described herein, except as expressly agreed to in writing by Aeroflex; nor does the purchase, lease, or use of a product or service from Aeroflex convey a license under any patent rights, copyrights, trademark rights, or any other of the intellectual rights of Aeroflex or of third parties.

## DATA SHEET REVISION HISTORY

<b>Revision Date</b>	<b>Description of Change</b>	<b>Page(s)</b>	<b>Author</b>
6/15	Added new datasheet format	All	Leslie
12/15	Added new Table 1, edited Master and Slave Mode AC Characteristics, and updated export disclaimer	3, 22, 28	Leslie
2/18	Edited Read Cycle text, Added parameters to DC and AC Characteristic tables, Edited Absolute Maximum, Replaced package drawing to correct lid height	9, 11, 12, 14, 15, 26	Nelson
